Bureau of Commercial Fisheries Biological Laboratory
Brunswick, Georgia

ABSTRACT

Salinity data secured on nine cruises of the M/V *Theodore N. Gill* off the south Atlantic coast of the United States are further processed and organized in a much more usable and readily available form. Surface water salinities are presented graphically by season.

INTRODUCTION

A general survey of those waters adjacent to our coast in the region from Cape Hatteras on the north to the Florida Straits on the south was begun in 1953 by the U.S. Fish and Wildlife Service in cooperation with two other Federal agencies and two State agencies. Nine cruises over a basic station plan (fig. 1) were completed with the vessel *Theodore N. Gill* from February 1953 to December 1954.

All of the basic physical oceanographic, biological, and chemical data, together with procedures and methods, have been published by individual cruise; (Anderson, Gehringer, and Cohen, 1956a and 1956b; and Anderson and Gehringer, 1957a, 1957b, 1958a, 1958b, 1959a, 1959b, and 1960). Bottom sediments were reported by Moore and Gorsline, 1960.

This is the second in a series of reports presenting a further processing

of the physical oceanographic and chemical data preparatory to a summarization of conditions along the south Atlantic coast of the United States, as revealed by the nine *Gill* cruises (the first report, Anderson, Moore, and Gordy, 1961, covered water temperatures). The data will also be organized in a much more usable and readily available form for fishery biologists in their studies of the fishes, shrimps, and other organisms of the region.

PROCEDURES

Sections

There are 16 sections as established from the pattern of east-west lines of stations (fig. 1). These are named and composed of stations as established in the individual cruise reports and shown in tables 2 to 14.

Areas

The region was divided into three areas--southern, central, and northern. Each area was split into three sub-areas: inner shelf--which extended

Note.--William W. Anderson, *Fishery Research Biologist*, Joseph E. Moore, *Analytical Chemist*, and Herbert R. Gordy, *Physical Science Technician*.

generally from the beaches seaward to about 15 fathoms; outer shelf--from about 15 fathoms seaward to about 100 fathoms; and offshore--mostly in the Gulf Stream. This is illustrated in figure 2, together with the stations comprising each sub-area.

Data from the special stations and standard station are excluded from this division and are presented separately.

Seasons

Four general seasons are applied--winter (cruise nos. 1 and 5), spring (cruise nos. 2 and 6), summer (cruise nos. 3, 7, and 8), and fall (cruise nos. 4 and 9). Winter cruises were made from January to mid-March, spring cruises during April and May, summer cruises from mid-June to September, and fall cruises from October to mid-December.

General

Salinity data used in compilation of the various tables were the interpolated and calculated data from the nine *Gill* cruise reports.

Basic salinities are given to the hundredth of a part per thousand, and averages to the nearest tenth of a part per thousand.

No data below 1,000 meters standard depth are included--such were available on only a few stations.

Profiles of the sections, by cruise, were published in the individual cruise reports.

Average surface water salinities for the four seasons, and for areas near the special stations and standard station, are shown in figures 3 to 6.

Figure 1.--Basic station plan.

Figure 2.--Areas, sub-areas, and stations comprising sub-areas.

Figure 3.--Average winter surface water salinities (‰).

Figure 4.--Average spring surface water salinities (‰).

Figure 5.--Average summer surface water salinities (‰).

Figure 6.--Average fall surface water salinities (‰).

ACKNOWLEDGMENTS

Several members of the staff of the Bureau of Commercial Fisheries Biological Laboratory, Brunswick, Georgia, aided in various ways and we express our appreciation to them. These are Jack W. Gehringer, Mary E. Cobb, Mabel Jo Knight, and E. Reid Poe.
